

# Air source heat pump energy storage system

How does an air-source heat pump work?

An air-source heat pump can provide efficient heating and cooling for your home. When properly installed, an air-source heat pump can deliver up to three times more heat energy to a home than the electrical energy it consumes. This is possible because a heat pump transfers heat rather than converting it from a fuel like combustion heating systems.

What is a heat pump & thermal energy storage system?

Heat pumps and thermal energy storage for cooling HPs can be reversed with additional valves to extract heat from the dwelling, thus provide cooling. Technically speaking HPs are thus vapour-compression refrigeration system (VCRS).

Why is heat pump and thermal energy storage important?

Heat pumps and thermal energy storage for heating TES is very important in HP systems since it decreases the thermal capacity to less than the maximum heating requirement and enables a larger share of renewables. It balances system operation and allows an HP to operate at full capacity throughout the year, hence the SPF increases.

Is a ground source heat pump better than an ASHP?

TES is an integral part of ground source energy. Without the benefit of thermal energy storage provided by the thermal inertia of the ground, a ground source HP would have no performance advantage over an ASHP. An ASHP extracts heat from ambient air: as the air temperature falls an air source heat pump becomes less efficient.

How much energy does an air source heat pump save?

When displacing oil (i.e., the oil system remains, but operates less frequently), the average annual savings are nearly 3,000 kWh (or about \$300). The different types of air source heat pumps are described below.

Could solar-powered heat pumps and thermal storage save money?

A UK research group has proposed the combination of solar-powered heat pumps and thermal storage based on phase-change materials for residential applications. They said such a system could facilitate cost savings of up to 39%. Heat pump system with two separate PCM thermal stores

The heat pump - this is the box to the left of the picture that sits outside your house and extracts energy from the outside air.; The internal heating system - this is the water system that runs through your existing pipes, heats up your home ...
