

Construction of solar power stations covering tens of thousands of acres

How much area do solar power plants need?

Generation-weighted averages for total area requirements range from about 3 acres/GWh/yr for CSP towers and CPV installations to 5.5 acres/GWh/yr for small 2-axis flat panel PV power plants. Across all solar technologies, the total area generation-weighted average is 3.5 acres/GWh/yr with 40% of power plants within 3 and 4 acres/GWh/yr.

Does a 30 year old photovoltaic plant occupy less land?

A 30-year old photovoltaic plant is seen to occupy ~15% less land than a coal power plant of the same age. As the age of the power plant increases, the land use intensity of photovoltaic power becomes significantly smaller than that for coal power.

How much land do solar power plants use?

For direct land-use requirements, the capacity-weighted average is 7.3 acre/MWac, with 40% of power plants within 6 and 8 acres/MWac. Other published estimates of solar direct land use generally fall within these ranges.

How many acres is a 617 MW solar farm?

The 617 MW solar farm covers around 6,350 acres of land, consisting of 3,500 acres of developed land and 2,000 acres of preserved land. Gradually commissioned since February 2013. Reached final capacity November 2014. Phase I of 300 MWAC completed 2013. Phase II to final capacity completed January 2015. Largest in Arizona.

What is the value of land for hosting solar energy?

To define the value of land for hosting solar energy, a yield in terms of energy output per unit of land has been defined for every AEZ.

What is the cost of a utility-scale solar project?

Utility-scale solar projects, which often exceed 100MW, can generate a profit of approximately \$20,000-\$40,000 per acre (YSG Solar 2022). Developers typically seek land within two miles of an electrical substation and within 1,000 feet of three-phase power.
