

Overview Drag- versus lift-based machines General aerodynamic considerations Characteristic parameters Horizontal-axis wind turbine Axial momentum and the Lanchester-Betz-Joukowski limit Angular momentum and wake rotation Blade element and momentum theory All wind turbines extract energy from the wind through aerodynamic forces. There are two important aerodynamic forces: drag and lift. Drag applies a force on the body in the direction of the relative flow, while lift applies a force perpendicular to the relative flow. Many machine topologies could be classified by the primary force used to extract the energy. For example, a Savonius wind turbine is a drag-based machine, while a Darrieus wind turbine and conventional
