Do distributed photovoltaic systems contribute to the power balance?

Tom Key, Electric Power Research Institute. Distributed photovoltaic (PV) systems currently make an insignificant contribution to the power balance on all but a few utility distribution systems.

Can inverter-tied storage systems integrate with distributed PV generation?

Identify inverter-tied storage systems that will integrate with distributed PV generation to allow intentional islanding (microgrids) and system optimization functions (ancillary services) to increase the economic competitiveness of distributed generation. 3.

Do energy storage subsystems integrate with distributed PV?

Energy storage subsystems need to be identified that can integrate with distributed PV to enable intentional islanding or other ancillary services. Intentional islanding is used for backup power in the event of a grid power outage, and may be applied to customer-sited UPS applications or to larger microgrid applications.

Why is distributed solar so expensive?

Distributed solar has so many cost factors that the price spike in polysilicon - which still accounts for more than 25% of module costs - barely changed the financial formula, enabling small-scale PV to dominate. Many countries have boosted rooftop solar with new policies but these are simply riding the wave, not causing it.

How are PV and storage market prices influenced?

On the other hand, PV and storage market prices are influenced by short-term policy and market drivers that can obscure the underlying technological development that shapes prices over the longer term.

How do PV systems integrate with a utility?

Integration issues need to be addressed from the distributed PV system side and from the utility side. Advanced inverter, controller, and interconnection technology development must produce hardware that allows PV to operate safely with the utility and act as a grid resource that provides benefits to both the grid and the owner.
