

# District energy storage system sales information

Can a district heating system store energy?

District heating systems can be used to store energy- for example, a district heating system with thermal storage that uses electricity to heat up water stored in tanks for later use when green power is less plentiful.

Who owns a district energy system?

In some cases, the buildings connected to a district energy system are commonly owned, such as in a university campus or hospital setting. In others, the buildings have separate owners, such as in a central business district or segment of a municipality.

Where are district energy systems located?

In the United States, district energy<sup>1</sup> systems are typically located on university or college campuses; on hospital or research campuses; on military bases and airports; and in areas of dense building settings, often in the central business districts of larger municipalities (common applications shown in Figure 2).

Can thermal energy storage be used in district heating and cooling system?

This paper deeply reviews the use of thermal energy storage in district heating and cooling system. The following topics are investigated: Advantages and disadvantages of connecting TES to DHC, with a particular analysis of the various sources that can be used to feed DHC.

What is 4th generation district energy?

4th generation district energy has three key advantages: It can use multiple energy sources and switch between them; it provides thermal storage - from an hourly to a seasonal basis, and it connects sectors (heating, cooling, electricity, industry), creating one integrated smart energy system.

Which tank storage systems are connected to district heating networks?

The two largest seasonal tank storage connected to district heating networks are the Friedrichshafen storage and the Kungälv storage. These T-TESs are respectively 12.000 m<sup>3</sup> and 10.000 m<sup>3</sup>. These are fed with a solar collector plant connected to DH system. DH utilizes both solar energy and boiler plants in order to cover the heat demand.
