

# Diy solar sun chaser

Is the Sunchaser 8 a good solar tracker?

This is not one of the toys that hold a few panels and disappear in the first bad weather event. The Sunchaser 8 is a genuine commercial product, and has been installed in major solar generation farms around the world. Most solar trackers of this size need to have a crane on site to complete installation.

How to build a solar tracker?

To build this tracker, you'll need The first step of this project is to build the base and attach the wheels, then build a sturdy frame for attaching the panel. After the frame is built and the panel is attached, the linear actuator and sensor need to be installed for the unit to properly track the movement of the sun.

How does a solar tracker work?

The system uses a LED sensor that senses the path of the sun and tells the actuator how to move so the panel stays properly oriented to gain maximum sun exposure. To build this tracker, you'll need The first step of this project is to build the base and attach the wheels, then build a sturdy frame for attaching the panel.

Can a solar tracker follow the sun through a single axis?

Solar power is one of the most accessible types of renewable energy and is rapidly increasing in efficiency and affordability. For this project, we will show you how we used our PA-14 Mini Linear Actuator to follow the sun through a single axis of motion using a custom built solar tracker.

How do solar panels work?

Solar panels are most efficient when they face directly toward the sun. A fixed panel can only capture optimal sunlight for a limited time during the day. A sun tracking system increases the time the panel is exposed to direct sunlight, thereby enhancing the overall energy output by up to 30-40%.

How can a solar panel detect the sun's position?

The circuit for this project is relatively simple. We will use two LDRs placed on either side of the solar panel to detect the sun's position. The Arduino will compare the readings from the two LDRs and adjust the servo motor to align the solar panel with the sun.

One option for greener energy is to use a device called a heliostat, which uses a mirror to direct the sun's light onto a target throughout the day. Such a device can be used for many applications, from concentrating solar energy onto the heat ...
