

Why do data centres use lithium ion batteries?

1. Lithium-ion Batteries Use of Li-ion has grown rapidly in data centres. As the Uptime Institute reported, this is mainly due to better energy density, rechargeability and management. It says "Li-ion energy storage is also regarded as a key component in renewable energy distribution, which is being adopted primarily to reduce carbon emissions."

Are battery energy storage systems the future of sustainable data centers?

With its use of renewable energy, swift energy ramp rate, and resiliency in data backup, battery energy storage systems are the future of sustainable data centers. Chris is an electrical engineer focused on the design of power distribution systems for commercial scale solar Photovoltaic, BESS, and EV charging facilities.

Can a data center use a battery energy storage system?

However, BESS can be used in conjunction with a UPS to help guarantee a data center will continue to function during power outages. Another thing to keep in mind is battery energy storage systems are a newer technology, so many states are still determining permitting processes for battery storage use.

Should data centres rethink battery energy storage?

Add to this the serious issue of battery waste and the toxic process of recycling them and it is clear that now is the time for data centres to take another look at their power supply, sourcing more environmentally safe, longer-term solutions. In today's world, battery energy storage has a far broader - and more crucial - role to play.

What is a battery energy Storage system?

A Battery Energy Storage Systems (BESS) can also protect the facility, should the utility be constrained and unable to meet peak power needs. When this happens, BESS can bridge the gap with more power required during peak times. Often sized for the whole site or, at least for critical loads, BESS energy can be used when grid supply is unstable.

Are lithium batteries sustainable?

Lithium is not the only battery technology option available. More sustainable battery types, with high enough energy densities, are being developed and some may start to compete as they become more cost-effective; these include flow batteries, zinc nickel and sodium-ion.
