

How spectroscopy can improve energy storage in electrochemical energy storage devices?

Understanding energy storage mechanisms in electrochemical energy storage devices lays the foundations for improving their energy and power density. Here we introduce in situ ultraviolet-visible (UV-Vis) spectroscopy method to distinguish battery-type, pseudocapacitive and electrical double-layer charge storage processes.

What is a surface-cleaning strategy?

A surface-cleaning strategy is designed to simplify the cathode interface. Improved electrochemical performance is achieved by cleaning the cathode surface. Surface impurity is the reason that triggering the oxidation of sulfide electrolytes. Oxidation of sulfide electrolytes is alleviated by surface-clean strategy.

What materials can be used for energy storage & conversion systems?

Aside from the direct use of pristine MOFs for energy storage and conversion systems, MOF-derived materials such as metal oxides, metal sulfides, carbon or composites, can also be adopted.

Why do we need new materials for energy storage & utilization?

As modern society develops, the need for clean energy becomes increasingly important on a global scale. Because of this, the exploration of novel materials for energy storage and utilization is urgently needed to achieve low-carbon economy and sustainable development.

What is the role of SC in energy storage systems?

Because of the high power outputs, SCs can be used in hybrid electric vehicles and fuel cell vehicles as the auxiliary start, power compensation, start-stop or temporary storage systems during braking. Therefore, SCs can potentially play an equally important role as batteries in future energy storage systems.

Can laser treatment remove surface contaminants from lithium metal substrates?

This study demonstrates the efficacy of laser treatment for removing superficial contaminants from lithium metal substrates. To this end, picosecond-pulsed laser radiation is proposed for modifying the surface of lithium metal substrates.
