

# Fishing at the West Bay Solar Power Plant

Are California ports ready for wind energy?

State officials acknowledge that no ports in the state are ready to do the job. Getting them ready could mean turning swaths of California's coast into industrial zones. The Port of Long Beach is the only California port even remotely prepared to handle the wind energy workload.

Is offshore wind energy a new concept in California's marine waters?

"Offshore wind energy generation is a novel concept in California's marine waters. Floating technologies are also still relatively new, and much is unknown about their environmental impacts," the agency wrote.

Are floating wind farms coming to the Pacific Ocean?

Nearly 600 square miles of ocean off California have been leased for floating wind farms.

Could Ocean Energy fill a power gap in California?

The goal is to jumpstart an industry that could help fill power gaps as California tries to achieve its goal of transitioning to an all-renewable electric grid by 2045. But for all the interest in renewable energy -- and the government subsidies -- public investment in ocean energy has lagged.

Who is responsible for California's offshore power project?

The State Lands Commission will be the lead agency for the environmental review, while the Coastal Commission is responsible for issuing a coastal development permit. California's offshore power generation will feed into a federal goal of 15 gigawatts by 2035.

Is California developing a wave energy project?

California is already hosting wave energy projects. One such project is being assembled at AltaSea, a public-private research center. It supports marine scientists focusing on the Blue Economy and operates out of a 35-acre campus at the Port of Los Angeles.
