

What is a flywheel energy storage system?

Flywheel energy storage systems (FESSs) store mechanical energy in a rotating flywheel that convert into electrical energy by means of an electrical machine and vice versa the electrical machine which drives the flywheel transforms the electrical energy into mechanical energy. Fig. 1 shows a diagram for the components that form a modern FESS.

How motor dynamics are related to power flow from controller to flywheel?

The motor dynamics are related to the power flow from controller to the flywheel or the other way. The sub-system calculates the losses in the PM machine and the rotating system. As losses are frequency, speed and load dependent speed and power inputs are given to sub-system to calculate the losses.

How long is a flywheel for 10kwh storage?

The flywheel for 10kWh storage is considered as 550 mm long having outer diameter of 250 mm. The wheel along with motor is suspended through two radial and an axial magnetic bearings. Considering the estimated loss of the bearings, RTE can be determined for the entire FESS as shown in tables 2 and 3.

Can hybrid space vector pulse width modulation reduce fess standby losses?

In the paper, a novel modulation technique based on hybrid space vector pulse width modulation (HSVPWM) is proposed to reduce the standby losses of the FESS.
