

Foreigners look at China's solar power plants

Are China's big solar farms influencing energy policy?

China is not only home to some of the biggest solar farms; its technology looks set to influence energy policy across the globe. But how feasible are these grand plans? Fly over "Datong County", a region in northern China, and you'll see two giant pandas. One is waving at you. They are made of thousands of solar panels.

How much solar power does China have in 2023?

China added almost twice as much utility-scale solar and wind power capacity in 2023 than in any other year. By the first quarter of 2024, China's total utility-scale solar and wind capacity reached 758 GW, though data from China Electricity Council put the total capacity, including distributed solar, at 1,120 GW.

Does China have more solar power than other countries?

China has more solar energy capacity than any other country in the world, at a gargantuan 130 gigawatts. If it were all generating electricity at once, it could power the whole of the UK several times over.

Why is solar power a problem in northwest China?

Most of the solar power in Northwest China is generated in utility-scale solar power plants, which led to power production that exceeded the targeted level in recent years. At the same time, the local demand for electricity was not growing enough to match with the rise of power supply.

Why is China the world's leading supplier of solar panels?

In that time China has become the world's leading supplier of solar panels, driving down costs all across the supply chain. That has helped make solar and wind installations in China economically competitive. Subsidies have played their part, as have regulations requiring each province to hit green energy targets.

Does China have a nuclear power plant?

So although China is installing solar and wind generation equivalent to five large nuclear power plants per week, their output is closer to one nuclear plant per week. Renewables account for more than half of installed capacity in China, but only amount to about one-fifth of actual energy output over a year, the CEF's Tim Buckley said.
