

# Generator room exhaust room

What is a generator room ventilation sheet?

This sheet allows you to calculate important parameters of the diesel generator room ventilation; Appropriate ventilation of the generator room transformer room and is important to help the motor burning cycle, reject the parasitic hotness produced during activity (motor hotness, alternator heat, and so on), and cleanse scents and exhaust.

Why should a generator room be ventilated?

Proper ventilation of the generator room is necessary to support the engine combustion process, reject the parasitic heat generated during operation (engine heat, alternator heat, etc.), and purge odors and fumes.

How do you design a generator room?

The ventilation system and overall layout of a generator room should be examined in detail during the design process. While a generator set is specified by the electrical engineer, the onus is on the mechanical engineer for an optimum design that maximizes the performance, longevity, and reliability of the genset.

Do generator rooms need air purging?

Generator rooms tend to be in need of air purging as buildup of engine exhaust and other output can be dangerous. Air ventilation systems can also play a role in generator noise reduction. By installing insulated air ducts and using smart layout in regards to where air inlet and outlet locations are, noise levels can be controlled.

Where should exhaust air be sourced for a generator?

For generators with remote radiators, it is recommended that the exhaust air should be sourced as high as possible and directly above the generator sets. Significant bypass of ventilation airflow directly into the discharge airflow will lead to reduction in cooling effectiveness and elevated temperatures within the room.

What is engine room ventilation?

This guide addresses engine room ventilation considerations that apply to the successful installation, operation and maintenance of Cat engines, generator sets, compressor units, and other packaged units. The primary aspects of a properly designed engine room ventilation system are cooling air and combustion air.
