

Graphical illustration of the relationship between wind frequency and power generation

How do wind turbines affect the frequency response of the power grid?

The increasing penetration of wind power leads to a decrease in the proportion of synchronous generators, which weakens the frequency response (FR) ability of the power grid. Wind turbines (WTs) are used to enhance the frequency stability of the power grid, which has become an important research trend.

How to predict wind farm output?

As the power output of wind turbines is strongly dependent on wind speed of a potential wind farm site, selection of appropriate wind speed model along with the power curve model is an important requirement for accurate prediction of wind farm output. Different wind speed modelling techniques have also been reviewed briefly in this paper.

What is the relationship between output power P_w (V) and wind speed v ?

The power curve gives a relation between the output power P_w (v) and wind speed v , and this relation can be expressed by a polynomial function of degree u as follows 48, 49, 50:

How a wind farm has a variable power output?

A wind farm having many wind turbine generators has variable power outputs due to variation of wind speed. Efficient power curve can be found by applying clustering methods. Power curve characterization by cluster centre, fuzzy C-means, and subtractive clustering methods is done in .

What is the theoretical power captured by a wind turbine?

The theoretical power captured (P) by a wind turbine is given by The power production of a wind turbine (WT) thus depends upon many parameters such as wind speed, wind direction, air density (a function of temperature, pressure, and humidity) and turbine parameters .

How can a combination of wind power and frequency support work?

In , the combination of the two methods can retain a 10% wind power margin and provide frequency support for a long period.
