

# How many meters are the wind blades of wind turbines

How many blades does a wind turbine have?

Most turbines have three blades which are made mostly of fiberglass. Turbine blades vary in size, but a typical modern land-based wind turbine has blades of over 170 feet (52 meters). The largest turbine is GE's Haliade-X offshore wind turbine, with blades 351 feet long (107 meters) - about the same length as a football field.

How do wind turbine blade dimensions affect energy production?

The wind turbine blades are the elongated objects protruding from the center of the motor. They are anywhere from 50 meters to 120 meters (164 ft. to 393.7 ft.). Wind flows through the blade and decreases air pressure on the other side. Therefore, the blade dimensions play a big role in determining energy production.

What is a typical wind turbine size?

For homeowners curious about wind technology, understanding typical wind turbine sizes can be helpful. According to The United States Department of Energy, most modern land-based wind turbines have blades of over 170 feet (52 meters). This means that their total rotor diameter is longer than a football field.

What is the longest wind turbine blade?

So far, the longest wind turbine blade on record is that of the Vestas-V236, which is 115.5 meters long. The Siemens Gamesa SG 14-222 DD is 108 meters (354.3 ft.) long. GE Haliade-X was the first wind turbine to introduce extra-long turbine blades in 2019, with a 107-meter (351 ft.) long blade.

What is the average rotor diameter of a wind turbine?

In 2023, the average rotor diameter of newly-installed wind turbines was over 133.8 meters (~438 feet)--longer than a football field, or about as tall as the Great Pyramid of Giza. Larger rotor diameters allow wind turbines to sweep more area, capture more wind, and produce more electricity.

Why is wind turbine blade size important?

Wind turbine blade size plays a big role in the amount of energy a turbine can produce. Simply put, larger blades equal more power, which is why there's been a consistent trend toward bigger turbines in the wind energy industry.

Horizontal-axis wind turbines are what many people picture when thinking of wind turbines. Most commonly, they have three blades and operate "upwind," with the turbine pivoting at the top of the tower so the blades face into the wind.
