

# How to install the density board of photovoltaic base

Can a PV system be installed on a village house?

PV system installed on roof of village houses Photovoltaic (PV) systems installed on roofs or roofs of stairhoods of village houses must comply with the specified requirements for green and amenity facilities and must be properly installed and not adversely affect the structural safety of the buildings.

How to plan a PV installation?

Surface Area: The surface area of the site at which the PV installation is intended should be known, to have an estimation of the size and number of panels required to generate the required power output for the load. This also helps to plan the installation of inverter, converts, and battery banks.

How high can a PV system be installed on a roof?

PV system installed on roof should not exceed 2.5m high. PV system exceeding the height of 1.5m should be certified by an Authorized Person who is registered under the Buildings Ordinance for submission of a safety certificate to the Lands Department for record. The average imposed load should not exceed 150kg/m<sup>2</sup>.

How much load can a PV system impose on a stairhood?

Extensible PV system If extensible PV system is installed, its fully extended area should not exceed half of the roof area. PV system installed on roof of stairhood should not exceed 1.5m high measured from the level of the roof of the stairhood. The average imposed load should not exceed 75kg/m<sup>2</sup>.

How many mm should a PV system project?

PV system should not project more than 750mm from external wall. For PV system arranged in the form of continuous spread covering, its coverage should not be more than half of the roof area. For PV system arranged in clusters, each cluster should have coverage of not more than 5m<sup>2</sup> and should be separated from each other by at least 1m.

How to calculate the size of a standalone PV system?

The size of the standalone PV system depends on the load demand. The load and its operating time vary for different appliances, therefore special care must be taken during energy demand calculations. The energy consumption of the load can be determined by multiplying the power rating (W) of the load by its number of hours of operation.
