

Is it easy to make a fan blade for generating electricity

How does a wind turbine generate electricity?

Wind power is collected using wind turbines --tall pole structures with a machine at the top that looks like a very large fan. Instead of blowing air, however, turbines catch the air. When the wind blows, it makes the blades of the fan, called rotors, spin around, which moves the turbine on the inside and generates electricity.

How do you set up a wind turbine fan?

Set up the fan so that it is directly facing the wind turbine. Pretend it is the wind, and make sure that the wind blows directly into the rotor. If the turbine is not tall enough, set it on top of a few short books until the fan can blow straight into it. When you have the fan and the turbine set up, turn the fan on to its lowest speed.

Can a fan be used as a generator?

Taking apart such a motor would likely allow one to make a generator, though I doubt it could produce much power. Mains-powered fans often use a different style of brushless motor which won't work well as a generator unless there's already AC voltage present.

How do you make a wind generator?

Build a simple wind generator. Use wind to power a motor and generate enough electricity to light an LED. Cut the sides of the small cup into four equal parts. Remove the base to create four curved pieces that will be the blades of the wind generator. Use hot glue to attach two craft sticks together at the center so they make a plus sign.

How many blades should a wind turbine have?

Whether you build or buy the blades, you'll likely want to have 3 blades on your wind turbine. Using an even number of blades, such as 2 or 4, makes a wind turbine more likely to vibrate as it spins. Adding more blades increases torque but can make the turbine rotate more slowly.

Can you build a wind generator?

Either way, with a handful of inexpensive and easy-to-source materials, you can build a homemade wind generator, making electricity yours for the taking for as long as the wind is blowing. You'll be able to light up that storeroom, power your barn, or use a generator to keep all your vehicle batteries charged.

By attaching blades to the motor, wind can be used to provide mechanical energy to the motor so that it works like a generator and supplies electricity. This electrical output could be measured with a multimeter, but an LED provides an ...
