

# Mine photovoltaic energy storage policy regulations

Do states need a new energy storage policy?

As states increasingly declare decarbonization goals, they will need to create new policies, rules and regulations that will enable the deployment of an unprecedented amount of energy storage, according to the Clean Energy States Alliance (CESA), which just released its States Energy Storage Policy: Best Practices for Decarbonization report.

What are the different types of energy storage policy?

Approximately 16 states have adopted some form of energy storage policy, which broadly fall into the following categories: procurement targets, regulatory adaption, demonstration programs, financial incentives, and consumer protections. Below we give an overview of each of these energy storage policy categories.

Does state energy storage support decarbonization?

A recent report from the Clean Energy States Alliance highlights best practices, identifies barriers, and underscores the need to expand state energy storage policymaking to support decarbonization in the United States. Decarbonization is the move away from fossil fuel resources and toward renewable energy.

Which states have set policy for energy storage deployment?

At the time the study was conducted, 22 states (plus the District of Columbia) adopted decarbonization goals, however, not all have set policy for energy storage deployment. California and New York are cited as examples of states with "very advanced and sophisticated policy measures". Many others are beginning to assess energy storage policy needs.

Are photovoltaic solar energy systems safe?

The safe and reliable installation of photovoltaic (PV) solar energy systems and their integration with the nation's electric grid requires timely development of the foundational codes and standards governing solar deployment.

Do underground mining ventilation systems use electricity?

This study also indicated that underground mining ventilation systems use significant electricity-- in gold production, about 20% of total energy demand is used in ventilation. In the United States, electricity is used for processing metals, especially to generate process heat, for machine drive and in electrochemical processes.
