

National Energy Solar Thermal Power Generation

What is a solar thermal power plant?

Solar thermal power plants usually have a large field, or array, of collectors that supply heat to a turbine and generator. Several solar thermal power facilities in the United States have two or more solar power plants with separate arrays and generators.

What are the different types of concentrating solar thermal power systems?

There are three main types of concentrating solar thermal power systems: Linear concentrating systems collect the sun's energy using long, rectangular, curved (U-shaped) mirrors. The mirrors focus sunlight onto receivers (tubes) that run the length of the mirrors. The concentrated sunlight heats a fluid flowing through the tubes.

Could NREL's solar thermoelectric generator reduce the cost of converting solar energy?

NREL's solar thermoelectric generator could reduce the cost associated with converting large amounts of solar energy into electricity through a much simpler and scalable process which does not rely upon moving parts and transfer fluids.

Should NREL use solar energy?

If successful, NREL's solar thermal electric generator would be capable of greater than 15% conversion efficiency and less than \$0.5/watt, making it an economically viable approach to harness sunlight for electrical energy generation. Greater use of solar energy would reduce U.S. reliance on fossil fuels--strengthening America's energy security.

Can a solar-powered chemical reactor produce propylene?

Project Summary: This project aims to enable carbon-free production of propylene, a key industrial chemical used to produce plastics. The team will develop a novel solar-powered chemical reactor that produces propylene by removing hydrogen from propane.
