

National Energy Storage System Quote

Are energy storage systems cost estimates accurate?

The cost estimates provided in the report are not intended to be exact numbers but reflect a representative cost based on ranges provided by various sources for the examined technologies. The analysis was done for energy storage systems (ESSs) across various power levels and energy-to-power ratios.

What are the benchmarks for PV and energy storage systems?

The benchmarks in this report are bottom-up cost estimates of all major inputs to PV and energy storage system (ESS) installations. Bottom-up costs are based on national averages and do not necessarily represent typical costs in all local markets.

Which energy storage technologies are included in the 2020 cost and performance assessment?

The 2020 Cost and Performance Assessment provided installed costs for six energy storage technologies: lithium-ion (Li-ion) batteries, lead-acid batteries, vanadium redox flow batteries, pumped storage hydro, compressed-air energy storage, and hydrogen energy storage.

Are there other energy storage technologies besides LIBs?

There are a variety of other commercial and emerging energy storage technologies; as costs are characterized to the same degree as LIBs, they will be added to future editions of the ATB.

Which storage system has the highest RTE?

LFP and NMC have the highest RTE of any storage system included at approximately 84%. Vanadium RFBs have the lowest RTE of the battery systems of approximately 65%. Note that the 12-year calendar life for vanadium RFBs only applies to stacks, since the electrolyte life is unlimited.
