

# Old American solar power generation equipment

When did solar power start?

As the U.S. and Soviet Union raced to launch satellites and spacecraft, solar energy offered an attractive way to generate power far from Earth. In 1958, the U.S. launched Vanguard 1, the first solar-powered satellite. Its radically new power system, made up of six solar panels, enabled it to remain in orbit for over six years.

What is the solar energy manufacturing for America Act?

The Solar Energy Manufacturing for America Act, included in the Build Back Better Act (H.R. 5376) and passed in the House on November 19, 2021, would offer refundable manufacturing tax credits for many components in the PV value chain.

When did solar energy become a standard power system?

As NASA pushed further out into the solar system in the 1970s, photovoltaics became the standard power system for its spacecraft and remains so today. Back on Earth, solar energy technology continued to advance gradually through the mid-20th century but remained uncompetitive with cheap, readily available fossil fuels.

When did solar power become popular?

By the 1970s, the efficiency of solar cells had increased, and they began to be used to power navigation warning lights and horns on many offshore gas and oil rigs, lighthouses, and railroad crossing signals. Domestic solar applications began to be viewed as sensible alternatives in remote locations where grid-connected options were not affordable.

When was solar technology first used?

Some of the earliest uses of solar technology were actually in outer space, where solar was used to power satellites. In 1958, the Vanguard I satellite used a tiny one-watt panel to power its radios. Later that year, the Vanguard II, Explorer III, and Sputnik-3 were all launched with PV technology on board.

How much solar energy is produced in the United States?

A relatively small proportion of solar products sold in the United States is produced domestically.<sup>9</sup> In 2021, 23.5 gigawatts (GW) of solar capacity were installed in the United States. This accounted for 46% of total new electricity generating capacity additions that year.

Solar cells, which convert sunlight into electrical current, had their beginnings more than a hundred years ago, though early solar cells were too inefficient to be of much use. In April, 1954, researchers at Bell Laboratories demonstrated the ...
