

PV panels and inverter capacity ratio

What is the array-to-inverter ratio of a solar panel system?

The array-to-inverter ratio of a solar panel system is the DC rating of your solar array divided by the maximum AC output of your inverter. For example, if your array is 6 kW with a 6000 W inverter, the array-to-inverter ratio is 1. If you install the same-sized array with a 5000 W inverter, the ratio is 1.2.

What is PV module capacity and solar inverter capacity ratio?

The PV module capacity and solar inverter capacity ratio are commonly referred to as capacity ratio. Reasonable capacity ratio design needs to be considered comprehensively in the light of the specific project.

What is the average solar inverter load ratio?

At the end of 2016, smaller plants--those one megawatt (MW) or less in size--had an average ILR of 1.17, while larger plants--those ranging from 50 MW to 100 MW--had an ILR of 1.30. As solar plants have gotten larger, inverter loading ratios have increased. In 2010, the average solar PV system had an ILR of 1.17. By 2016, the average was 1.26.

How big should a solar inverter be?

Most installations slightly oversize the inverter, with a ratio between 1.1-1.25 times the array capacity, to account for these considerations. The size of the solar inverter you need is directly related to the output of your solar panel array. The inverter's capacity should ideally match the DC rating of your solar panels in kilowatts (kW).

What size inverter for a 5 kW solar array?

For example, a 5 kW solar array typically requires a 5 kW inverter. However, factors like derating, future expansion plans, and the array-to-inverter ratio influence the optimal inverter size. Most installations slightly oversize the inverter, with a ratio between 1.1-1.25 times the array capacity, to account for these considerations.

What is a good DC/AC ratio for a PV system?

A 1:0.8 ratio (or 1.25 ratio) is the sweet spot for minimizing potential losses and improving efficiency. DC/AC ratio refers to the output capacity of a PV system compared to the processing capacity of an inverter. It's logical to assume a 9 kWh PV system should be paired with a 9 kWh inverter (a 1:1 ratio, or 1 ratio). But that's not the case.

The DC-to-AC ratio, also known as the Array-to-Inverter Ratio, is the ratio of the installed DC capacity (solar panel wattage) to the inverter's AC output capacity. A typical DC-to-AC ratio ranges from 1.1 to 1.3, with 1.2 being a common value ...
