

Photovoltaic bracket grounding ring network

Why is proper grounding of a photovoltaic power system important?

Proper grounding of a photovoltaic (PV) power system is critical to ensuring the safety of the public during the installation's decades-long life. Although all components of a PV system may not be fully functional for this period of time, the basic PV module can produce potentially dangerous currents and voltages for the life of the system.

Does a photovoltaic system have a DC grounding system?

Photovoltaic systems having dc circuits and ac circuits with no direct connection between the dc grounded conductor and ac grounded conductor shall have a dc grounding system. The dc grounding system shall be bonded to the ac grounding system by one of the methods in (1),(2),or (3).

Do ungrounded PV systems need ground protection?

In all cases, an ungrounded array must be provided with equivalent protection for ground faults, as required by NEC 690.35. A PV system is defined as a grounded system when one of the DC conductors (either positive or negative) is connected to the grounding system, which in turn is connected to the earth.

What is grounding & bonding?

Grounding and bonding is a subject area that can be confusing to many. In this blog post, we summarize key points according to the NEC. The NEC is the primary guiding document for the safe designing and installation practices of solar PV systems in the residential and commercial markets in the United States.

Which service box is required for parallel connection of solar photovoltaic systems?

For parallel connection of solar photovoltaic systems, depending on the point of connection, the utility disconnecting means may be required to be an approved service box, as per Diagrams B1 and B3. Diagram B1 shows the parallel connection of solar photovoltaic systems where the PV system is directly connected to the supply authority.

How do PV array DC equipment grounding conductors work?

The PV array dc equipment grounding conductors, when connected to such inverters, have the array dc equipment grounding conductors connected to earth through the ac equipment grounding system and the existing ac grounding system. Additional grounding electrodes and grounding electrode conductors are not required, but may be used.
