

Can solar cells reduce the cost of PV hydrogen production?

Future technological advances in PV-hydrogen production systems, such as perovskite solar cells (PSCs) and noble metal-free cocatalysts for enhanced photocatalytic H<sub>2</sub> production [3,4,5], will play an important role in further reducing the levelized cost of PV hydrogen production.

What factors affect the future cost of PV-powered hydrogen production?

4.2.2. Projection of Future Levelized Cost of PV-Powered Hydrogen Production The uncertainty in the technological progress of both PV and electrolyzer hydrogen production is an important factor affecting the future cost of PV hydrogen production, which will, in turn, affect its economic efficiency.

Do batteries affect the price of hydrogen production in a photovoltaic plant?

Hydrogen price depends on electricity and utilization factor of the electrolyser. Batteries improve overall performance but penalize the system's economic balance. The aim of this work is to analyse the price of renewable hydrogen production in a stand-alone photovoltaic plant. The energy studied herein is generated in a photovoltaic plant.

How much does green hydrogen cost?

The sensitivity analysis in the case of a 1 MW plant was carried out with a range of electricity cost starting from \$0.0198 to \$0.0292, and the utilization factor ranging between 11.49% and 39.12%. The possible combinations between these values resulted in green hydrogen prices, whereby the cheapest stood at \$2.66 and the most expensive at \$6.83.

Can a 20 kW photovoltaic power station generate electricity for hydrogen production?

Fereidooni et al. (2018) studied the economic feasibility and annual performance of a 20 kW photovoltaic power station located in Yazd City, Iran, and found, through both experimental studies and simulations, that the region is capable of generating electricity for hydrogen production [10].

What is a PV hydrogen production techno-economic (PVH2) model?

Then, we constructed a PV hydrogen production techno-economic (PVH2) model. We used the levelized cost of hydrogen production (LCOH) method to estimate the cost of each major equipment item during the project lifetime. We combined the PVH2 and learning curve models to determine the cost trend of integrated PV-hydrogen technology.
