

Do photovoltaic power plants support frequency regulation?

Jibji-Bukar, F., Anaya-Lara, O.: Frequency support from photovoltaic power plants using offline maximum power point tracking and variable droop control. IET Renew. Power Gener. 13 (13), 2278-2286 (2019) Rajan, R., Fernandez, F.M.: Impact of distributed virtual inertia from photovoltaic sources on frequency regulation in hybrid power systems.

Do DPV inverters provide adaptive frequency support?

The main contributions of the paper are: The available power system inertia is considered in adaptive frequency support from DPV inverters. In this case, under low penetration of DPV inverter (high inertia system), the DPV inverters inject their maximum power to the grid.

How can inverters improve the frequency regulation ability of PVPP?

The longer the delays, the weaker the PVPP's ability to participate in primary frequency regulation. In addition, the optimization of PVPP communication system and control strategy of inverters can help improve the frequency regulation ability of the PVPP, thereby maintaining the frequency stability of the power system.

1. Introduction

What are the different types of frequency regulation methods for photovoltaic power generation?

At present, there are two main types of frequency regulation methods for photovoltaic power generation. One is to operate at the maximum power point, and release or absorb active power through energy storage equipment, so as to provide support inertia for the system to participate in frequency regulation.

Do photovoltaic systems improve frequency stability in hybrid power systems?

Tavakkoli, M., Adabi, J., Zabihi, S., Godina, R., Pouresmaeil, E.: Reserve allocation of photovoltaic systems to improve frequency stability in hybrid power systems. Energies 11 (10), 2583 (2018) Rajan, R., Fernandez, F.M.: Grid inertia based frequency regulation strategy of photovoltaic systems without energy storage.

Can a frequency droop-based control improve grid frequency response in DPV inverters?

This article proposes a frequency droop-based control in DPV inverters to improve frequency response in power grids with high penetration of renewable energy resources. A predefined power reserve is kept in the DPV inverter, using flexible power point tracking. The proposed algorithm uses this available power reserve to support the grid frequency.
