

Photovoltaic inverter mppt maximum input current

What is the maximum input current for a MPPT?

If each MPPT has two strings, the maximum input current for each string is 12.5A. If there is only one string, the string current is less than 25A. Inverter current peak clipping issue: What causes it? Inverter current peak clipping issue may occur when the selected component current exceeds the maximum input current of the inverter.

What happens if a PV inverter exceeds MPP current?

Should the MPP current of the PV array exceed the maximum input current ($I_{DC \text{ max.}}$) of the inverter in a particular system design, there will not be any potential for damage to the inverter. Exceeding the MPP current therefore also has no impact on the inverter's statutory warranty.

What is MPPT operating current limit?

2. Matching Max power input current. MPPT operating current limit reflects the maximum capability of the MPPT, thus in theory power loss due to input current limitation could happen when input current exceeds 12.5A, in above example. However, the impact of current clipping is negligible as the power clipping occurs simultaneously.

How many volts can a MPPT handle?

Each MPPT can accept 4000W, max 250V, the spec sheet says Max PV Input Current is 18A each. I tried to talk to the vendor to get guidance but it didn't help. I cannot find a way to wire together panels of any kind to hit a full 4000W on each MPPT even running in series to hit 240V and stay below the 18A max. Am I reading this wrong?

How to check backfeed current of inverter MPPT DC input?

Check backfeed current of inverter MPPT DC input. $I_{STRING} = I_{STRING \text{ MAX}}$ or $I_{BF \text{ TOTAL}}$ (whichever is greater) $I_{BF \text{ TOTAL}}$ is the backfeed current from sources other than the PV Array. It can be ignored with the SMA inverters listed in Table 1. These inverters produce zero backfeed current so $I_{BF \text{ TOTAL}}$ will always be less than $I_{STRING \text{ MAX}}$.

Can SMA inverters be used with high-current modules?

SMA inverters can easily be used with high-current modules. The absolute limit is the maximum connectable short-circuit current ($I_{SC \text{ PV}}$) of the inverter. The maximum input current ($I_{DC \text{ max}}$) of the inverter is not an absolute limit in the selection of the PV module. All SMA inverters can exceed $I_{DC \text{ max}}$ without any problems.
