

How do I choose a battery for a DIY solar panel?

Choosing the capacity for your battery is largely up to your budget, so for this basic DIY solar panel installation, we recommend a 12V solar panel 100 Amp hour (Ahr) battery. For any battery-backed DIY solar panel system, choosing a PWM charge controller, rather than a MPPT, will be less efficient, but more cost effective.

How many components do you need for a basic solar setup?

For a basic solar setup, the above 3 components will suffice. But before you get too happy, there is something that you need to know. The power we get from the solar setup is direct current (DC). The power we get from wall plugs is alternative current (AC). Which means, you simply cannot plug your house appliances directly into a basic solar setup.

How to choose a solar panel for a tilt roof?

In the case of tilt roofs, the angle of tilt must be known and necessary mounting must be used to make the panels have more incidents of solar radiation i.e. ideally the radiation angle must be perpendicular to the PV panel and practically as close as to 90 degrees.
