

Do solar panels need roof reinforcements?

Roof reinforcements may be necessary for some installations, depending on factors such as the roof's strength, the weight of the solar system, and local building code requirements. A structural engineer can evaluate the roof's condition and determine whether reinforcements are needed to support the additional load of the solar panels.

What factors should a solar structural engineer consider when designing a roof?

Solar structural engineering experts pay close attention to three main factors when designing solar structures to make sure solar installations work well and last. These are - a roof's load capacity, structural integrity and compatibility.

What is a solar structural engineer report?

Solar structural engineer reports play a critical role in facilitating the development of solar projects. These reports evaluate the design, materials, and construction methods employed in solar installations. They provide essential insights into the viability and durability of solar projects in various geographical locations and climates.

What is a solar panel mounting structure?

The solar panel mounting structure is usually made of mild steel or aluminum, which adds minimal weight but provides adequate support to the panels. The design of the rooftop installation should also account for the shading from adjacent buildings or objects.

Does VERTEX offer roof-mounted photovoltaic (PV) panels?

With the recent exponential growth in renewable energy technologies and installations, VERTEX has seen a steady increase in consultation for roof-mounted photovoltaic (PV) panels on both residential and commercial projects.

What are the structural calculations for solar panel installation?

The necessary structural calculations for solar panel installation typically involve determining the additional loads imposed by the panels, such as dead load, live load (snow or wind), and any dynamic loads associated with installation or maintenance.

NBG Solar Structures provide custom-engineered elevated steel structures, designed to support solar panels used in all types of applications. These solar support structures are an optimal solution for parking garages, solar farms, ...
