

# Photovoltaic panels are mostly used to raise animals

Can photovoltaic panels be used as shade resources for livestock?

Sheep unconditionally preferred shade from solar panels over 80%-blockage cloth. Photovoltaic panels are a novel alternative to shade animals. Based on our search, we believe that this is the first paper to evaluate the use of photovoltaic panels as shade resources for livestock.

Can photovoltaic panels protect livestock?

Photovoltaic panels can provide artificial shades to protect livestock against intense solar radiation while serving as a clean energy source, reducing CO emission, and providing an additional source of income to farmers. These benefits foster sustainable livestock farming practices.

Do photovoltaic panels block solar radiation?

Shade under photovoltaic panels was compared to shade under cloth that has 80% blockage of solar radiation based on time spent under the shade by sheep and ewes. The animals spent more than 70% of their time under the shade from photovoltaic panels when solar radiation was equal or greater than  $800 \text{ W m}^{-2}$ .

Are solar panels good for agrivoltaics?

Sheep take cover under the shade of solar panels at an agrivoltaics power generation farm Lianyungang City, China. The benefits aren't just one-sided in this symbiotic relationship. Solar panels directly benefit from their relationship with the plants, too. This is where some real agrivoltaic magic (science) happens.

Can photovoltaic panels provide shade for sheep managed in Paddock?

The objective of this study is to investigate the potential of co-generation systems using photovoltaic panels to generate electrical energy and to provide shade for sheep managed in paddock. This is the first study to present scientific data on photovoltaic panels as shading resources for livestock.

Do photovoltaic installations affect biodiversity?

However, the currently available evidence regarding the effects of photovoltaic installations on biodiversity is still scarce. More research is urgently needed on non-flying mammals and bats as well as amphibians and reptiles. Solar thermal panels and floating PV installations should also be further investigated.
