### Power generation solar thermal panels

What is solar thermal power generation?

Harnessing solar energy for electric power generation is one of the growing technologies which provide a sustainable solution to the severe environmental issues such as climate change, global warming, and pollution. This chapter deals with the solar thermal power generation based on the line and point focusing solar concentrators.

#### What is solar thermal energy?

Solar thermal energy (STE) is a form of energy and a technology for harnessing solar energy to generate thermal energy for use in industry, and in the residential and commercial sectors. Solar thermal collectors are classified by the United States Energy Information Administration as low-, medium-, or high-temperature collectors.

#### How does a solar thermal power plant work?

The most common type of solar thermal power plants, including those plants in California's Mojave Desert, use a parabolic trough design to collect the sun's radiation. These collectors are known as linear concentrator systems, and the largest are able to generate 80 megawatts of electricity [source: U.S. Department of Energy].

#### What is a solar thermal power plant in Spain?

A solar thermal power plant in Spain. Solar thermal power plants are electricity generation plantsthat utilize energy from the Sun to heat a fluid to a high temperature. This fluid then transfers its heat to water, which then becomes superheated steam.

#### Can solar thermal power plants be integrated with conventional power plants?

Solar thermal power plants have enormous potential to be integrated with the existing conventional power plants. The integration of CSP systems with conventional power plants increases the efficiency, reduces the overall cost, and increases the dispatchability and reliability of the solar power generation system.

#### What makes a solar thermal power plant an active system?

An active system requires some way to absorb and collect solar radiation and then store it. Solar thermal power plants are active systems, and while there are a few types, there are a few basic similarities: Mirrors reflect and concentrate sunlight, and receivers collect that solar energy and convert it into heat energy.

In a concentrating solar power (CSP) system, the sun"s rays are reflected onto a receiver, which creates heat that is used to generate electricity that can be used immediately or stored for later use. ... Solar thermal energy in this system is ...
