

# Profit per mu of wormwood planted under photovoltaic panels

How to plant a crop under a fixed PV system?

Crops suitable for planting under fixed PV systems, along with the crop growth parameters, should be identified. Agrivoltaic systems must water the plants on a daily basis. Material corrosion should be monitored since moisture under the solar panel may affect the plant structure.

Do agrivoltaic panels generate more energy during the day?

When compared to a control system with no crops below, the agrivoltaic system with PV panels generated between 3.05 % and 3.2 % more energy during the day.

Can a solar photovoltaic plant be combined with agricultural production?

To address competition for land, it is possible to combine the installation of a solar photovoltaic (PV) plant with agricultural production on the same area. This new production system was first devised and proposed in the 1980s to allow additional use of agricultural land.

Are agrivoltaic panels a candidate for co-production?

As a result, this panel type is a possible candidate for co-production. Planting corn under PV panels with 40 % spacing produced 5.6 % higher yields per square meter than regular lands. The agrivoltaic system influenced interested locals positively. Energy and food security, in particular, were provided.

Can a PV system be used for livestock farming?

A PV system for livestock farming could be implemented by allowing animals to roam and consume grasses around PV panels. The animals, such as sheep, goats, and cattle, could find shelter in the shade of the panels.

Can a fixed PV system be used for agriculture?

For a fixed PV system, such models could facilitate the selection of crops to be cultivated under specific climate conditions. Because agricultural plants require water, the moisture in the air surrounding the PV panel areas may have an effect on the PV structural materials.
