

Raising a dog under the photovoltaic panels

Can You Adapt A dog house with solar panels?

Adapting your dog house or other outdoor pet enclosure with solar panels is a fun and relatively easy DIY solar project. Here are the basic parts you'll need to get the job done:

Should you install a solar panel on your dog's roof?

If your pooch is in need of a more serious source of heat you may want to invest in having a solar panel system installed - or for do-it-yourself types (not me) check out any number of Youtube videos on the subject. The solar panel is typically installed on the roof of the dog house or in close proximity and is aligned with the sun.

What can I do with a dog house solar project?

Another neat idea would be to add a rotating statue on the roof or something along those lines. Or you could go all out and have a built-in waterfall watering dish fountain that rotates and has built-in LED lighting. Now we're cooking with gasoline! Dog house solar projects can add that immensely cool look and feel to your dog house.

Can a solar panel power a dog water dispenser?

By using a small copper coil of pipe wrapped around the water dispenser, the water heated by the solar panel would ensure your pet's water dish remained warm enough from the day's heat to ensure it didn't freeze at night. If you're really interested in taking your dog's space to the next level, solar power can be used to power a variety of perks.

Do dogs need a solar-heated dog house?

No doubt dogs are great at keeping themselves warm as their fur is a fantastic insulator that maintains their body temperature. With that said, even dogs might need a bit of heat in the chilly winters. If you're one for going green, then a solar-heated dog house can keep your dogs comfortable without increasing the carbon footprint.

Can a light bulb heat a small dog house?

A properly installed light bulb in a small dog house could provide a bit of warmth. However, it won't be much of an effective heating method. According to a rough estimate, a 60-75 Watt bulb should produce about 240 kJ of heat. Now, that's not a lot. But a little canine in a small dog house would feel comfortable with such a heat source.
