

Residual current detection in energy storage cabinet

What is a residual current detection system?

After the design of the residual current detection system was completed, the test verification was carried out. The purpose was mainly to test the attenuation effect of the magnetic shielding cover on the magnetic field and the residual current detection ability in the face of the AC and DC situations of the substation.

What is a residual current monitor?

The residual current monitors of the VARIMETER RCM family, with external or also integrated residual current transformers, permanently monitor your plant for fault currents. Degradation of insulation is indicated at an early stage so that preventive maintenance and servicing measures can be initiated.

Does the DC component influence tripping threshold of residual current devices?

The DC component included in the earth fault current influences the tripping threshold of residual current devices (RCDs)--the devices which are mandatory in certain locations. This paper presents results of the AC-type, A-type, and F-type RCDs sensitivity testing under residual currents of various compositions of the DC component.

What are the benefits of residual current sensing system?

The designed residual current sensing system has a small error, good response ability, and field measurement stability. This design can improve the accuracy and stability of system measurements, and it can reduce energy waste and improve the overall energy efficiency of the power system by implementing effective measures.

Do RCDS detect a DC component in residual current?

In PV installations and in EV charging installations, one should take into account the possibility of the appearance of a DC component in the residual current. As shown by the results of above-presented laboratory tests, A-type and F-type RCDs are able to detect slowly rising residual current with a very high content of the DC component.

Can a tunnel magnetoresistive sensor detect complex ac and DC residual currents?

To ensure the stable detection of complex AC and DC residual currents, the measurement system presented in this paper utilizes the tunnel magnetoresistive sensor as a crucial detection device. Its primary structure comprises a magnetic tunnel junction consisting of a ferromagnetic layer-insulator layer-ferromagnetic layer [18,19,20].
