

Are service lifetime and degradation models suitable for PV modules?

The latest scientific work shows that service lifetime and degradation models for PV modules are of specific use if they combine different modelling approaches and include know-how and modelling parameters of the most relevant degradation effects.

Why do we need reliable service lifetime prediction of PV modules & components?

For example, reliable service lifetime predictions aid: PV module and components manufacturers to provide more realistic warranties, PV project investors to make good financial decisions, and consumers to increase their trust in PV energy. More reliable service lifetime prediction of PV modules and components is still quite a challenge.

What is the end-of-life of a PV module?

An overview of potential module failures, influencing factors and effects can be found in a previous report of IEA PVPS Task 13. End-of-life is defined differently for PV modules, depending on the specific context or issue. The end-of-life is typically dependent on the use of the PV module and the specific conditions of the PV power plant.

Does electrical-induced degradation affect PV backsheet performance?

Electrical-induced degradation is also an important factor that affects PV backsheet easily during the operation of PV system. Since 2011, the influence of electrical-induced degradation on the performance of PV backsheet has received considerable attention, which provides significant theories and methods for subsequent research.

What factors affect the end-of-life of a PV power plant?

The end-of-life is typically dependent on the use of the PV module and the specific conditions of the PV power plant. Current levelized costs of energy (LCOE) compared to replacing the modules or the operation and maintenance costs of modules are often influencing factors.

What are the environmental stressors associated with PV backsheet failures?

Fig. 1. (a) Solar PV power generation in the Net Scenario, 2010-2030; (b) Environmental stressors associated with PV backsheet failures. PV backsheet can suffer from several stressors in specific ambient; (c) Two main types of defects on backsheet observed in the field, including blistering (left) and cracking (right).
