

Smart Grid and Microgrid Homework

What are microgrids & smart grids?

Microgrid meaning localized energy systems, enhance resilience and sustainability, promoting local autonomy. They come in various types of microgrids, operating independently or with the main grid. Smart grids, employing digital technologies, create an adaptive grid integrating diverse energy sources.

What are the challenges to connecting microgrid system to distribution grid?

Despite many advantages of microgrids, there are major challenges to connecting microgrid system to distribution grid. These challenges can be classified as technical challenges associated with control and protection system, regulation challenges and customer participation challenges.

What are the key features of a smart grid?

Key features of a smart grid are listed below: 1. Two-Way Communication Smart grids provide clear, two-way communication between utility operators and end users. This creates an established management process for the grid. 2. Advanced Metering Infrastructure Move past traditional meters; it's the time of smart meters.

What is the operation principle of dc microgrid?

The operation principle of DC microgrid is similar to AC microgrid. Compared with AC microgrid, DC microgrid is a good solution to reduce the power conversion losses because it only needs once power conversion to connect DC bus. Therefore, DC microgrid has higher system efficiency, lower cost and system size.

Is Wi-Fi a good technology for a smart grid?

Especially, Wi-Fi is a superior technology for the HAN of the Smart Grid. WiMAX (Worldwide Interoperability for Microwave Access) also known as the IEEE 802.16 standard is a wireless broadband technology. It supports thousands of simultaneous users over large distance (up to 48 km) with high data rates up to 70 Mbps.

What technologies can be used in a microgrid system?

Two types of generation technologies can be implemented into microgrid systems: renewable resources such as solar photovoltaics (PV), wind, small hydro power, ocean, etc.; non-renewable resources such as reciprocating engines, gas turbines, modern Combined Heat and Power (CHP) units etc. .,
