

What is a solar power tower?

A solar power tower, also known as 'central tower' power plant or 'heliostat' power plant, is a type of solar furnace using a tower to receive focused sunlight. It uses an array of flat, movable mirrors (called heliostats) to focus the sun's rays upon a collector tower (the target).

How does a solar power tower work?

A solar power tower consists of an array of dual-axis tracking reflectors (heliostats) that concentrate sunlight on a central receiver atop a tower; the receiver contains a heat-transfer fluid, which can consist of water-steam or molten salt. Optically a solar power tower is the same as a circular Fresnel reflector.

Why are solar towers called heliostat power plants?

Solar towers are sometimes also called heliostat power plants because they use a collection of movable mirrors (heliostats) laid out in a field to gather and focus the sun at the tower. By concentrating and collecting solar energy, solar towers are considered a type of renewable energy.

What is a power tower concentrating solar power plant?

In summary, the power tower concentrating solar power plant, at the heart of which lies the heliostat, is a very promising area of renewable energy. Benefits include high optical concentration ratios and operating temperatures, corresponding to high efficiency, and an ability to easily incorporate thermal energy storage.

Why are solar tower power plants becoming more widespread?

Mounting challenges of climate change and worldwide energy shortage has made solar power one of the world's most dynamic and reliable sources of energy. With this global trend towards renewable solar energy, it is no surprise that solar tower power plants are becoming more widespread.

Are solar power towers sustainable?

In addition, systems generating solar energy, like the solar tower power plant, are sustainable and comparatively cheaper than conventional Photovoltaic systems. Solar power towers are highly reliable. Comparatively, PV systems fall slightly behind in this regard as they rely highly on direct sunlight.

Overview
Current technology
Comparison between CSP and other electricity sources
History
CSP with thermal energy storage
Deployment around the world
Cost
Efficiency
CSP is used to produce electricity (sometimes called solar thermoelectricity, usually generated through steam). Concentrated solar technology systems use mirrors or lenses with tracking systems to focus a large area of sunlight onto a small area. The concentrated light is then used as heat or as a heat source for a conventional power plant (solar thermoelectricity). The solar concentrators use...
