

# Solar automatic tracking bracket diagram

What is an automatic solar tracker system?

An Automatic Solar Tracker System is a game changer for increasing the efficiency of solar panels. This project digs into the development of an Arduino-based solar tracker system that detects sunlight using Light Dependent Resistors (LDR) and changes the position of the solar panel using a servo motor.

What is a circuit diagram for a solar tracker system?

The circuit diagram that is included gives us an understanding of the hardware arrangement that serves as the foundation for our Automatic Solar Tracker System. A 3-watt, 5-volt solar panel serves as the main energy source for the system.

How does a solar tracking system work?

The amount of rotation was determined by the microcontroller, based on inputs retrieved from four photo sensors located next to solar panel. At the end of the project, a functional solar tracking system was designed and implemented. It was able to keep the solar panel aligned with the sun, or any light source repetitively.

Can a solar panel track the sun using only one rotational axis?

These tracking systems often using two axes of movement. This project is to design a system that will allow a solar panel to track the sun using only one rotational axis, which saves energy and uses fewer parts. The system tracks the entire range of the sun's motion and has positional feedback to allow control of the solar panel's angle.

Can a solar tracking system improve output power?

At the end of the project, a functional solar tracking system was designed and implemented. It was able to keep the solar panel aligned with the sun, or any light source repetitively. A quantitative measurement was also performed, which reported how well tracking system improved output power in comparison with fixed mount.

Can a light tracking system be applied to any solar energy system?

The goal of this project is to build a prototype of light tracking system at smaller scale, but the design can be applied for any solar energy system in practice. It is also expected from this project a quantitative measurement of how well tracking system performs compared to system with fixed mounting method.

A solar tracker can be either: Single-axis solar tracker. Dual-axis solar tracker. Single-axis solar tracker. Single-axis trackers follow the position of the sun as it moves from east to west. These are usually used in utility-scale solar projects. ...
