

# Solar generator rate of return

How much is a solar return on investment?

Here, the net return on the investment could be considered \$20,000 (\$36,000 in value, less \$16,000), which divided by \$16,000 and multiplied by 100% would equal a solar ROI of 125%. Although we have just illustrated how to calculate your solar ROI, this formula should always be taken with a grain of salt.

What is solar return on investment (ROI)?

Return on investment (ROI) is related to the solar payback period. Instead of calculating the time it takes to break even, ROI calculates the total amount of money and savings that a PV array will provide over its lifetime. Here is a simplified version of this calculation: Lifetime utility costs - lifetime cost of solar = Solar System ROI

What factors affect your solar return on investment?

In reality, there are many other factors that will influence your exact solar return on investment. For instance, when looking at long-term performance, solar panels slowly lose efficiency over time. This means that your system will not always produce the same amount of electricity each year, with smaller outputs generated as your equipment ages.

How do you calculate solar payback?

You can calculate the solar payback period with a simple formula:  $(\text{Initial Cost}) / (\text{Annual Savings}) = \text{Solar Payback Period}$ . For example, let's say the initial purchase cost of a solar system was \$15,000. This solar array ends up saving the homeowner an average of \$1,500 per year against on-grid energy costs.

How much do solar projects pay back a year?

This will help you get to a practical assumption. Generally speaking, the internal rate of returns for solar projects are anywhere from 6-10% with a payback period of 7-10 years. This is in the absence of renewable energy credits (RECs) or other statewide assumptions.

Should solar panel degradation be factored into ROI calculations?

Panel degradation should be factored into ROI calculations and solar panel return on investment calculations, since panels will put out a bit lower production near the end of their lifespan. Electricity rates have risen gradually over the past few decades, from 1% to 6% a year depending on the area.

The quick and easy way to find out if solar panels are worth it for your home is to use our Solar Savings Calculator. Just punch in your address and select your average electricity bill to get an estimate of how big of a solar ...
