

What is the future dynamic photovoltaic (PV) power generation potential?

In this study, the future dynamic photovoltaic (PV) power generation potential, which represents the maximum PV power generation of a region, is evaluated. This study predicts suitable land resources for PV systems and calculates the PV generation potential based on these predictions.

Why is it important to assess photovoltaic power generation potential in China?

Clear spatial dislocations between PV power generation potential and population distribution and electricity demand. Accurate assessment of the photovoltaic (PV) power generation potential in China is important for the reduction of carbon emission intensity and the achievement of the goal of Carbon Neutral.

Where is PV power generation mainly concentrated in Xinjiang & Inner Mongolia?

In terms of provinces, PV potential is mainly concentrated in Xinjiang, Inner Mongolia, Qinghai, and other provinces west of the Hu Huanyong Line (Population Distribution Line). The PV power generation potential of the provinces east of this line basically does not exceed 3 PWh, and most of them do not exceed 1 PWh.

What is the progress made in solar power generation by PV technology?

Highlights This paper reviews the progress made in solar power generation by PV technology. Performance of solar PV array is strongly dependent on operating conditions. Manufacturing cost of solar power is still high as compared to conventional power. **Abstract**

Which land is suitable for PV power generation in China?

The results showed that the average suitability score of land in China is 0.1058 and the suitable land for PV power generation is about 993,000 km² in 2015. The PV power generation potential of China is 131.942 PWh, which is approximately 23 times the electricity demand of China in 2015.

What is remote sensing derived dataset for large-scale photovoltaic power stations in China?

We provide a remote sensing derived dataset for large-scale ground-mounted photovoltaic (PV) power stations in China of 2020, which has high spatial resolution of 10 meters. The dataset is based on the Google Earth Engine (GEE) cloud computing platform via random forest classifier and active learning strategy.
