

How to choose a solar thermal power plant?

Solar thermal power plants for electricity production include, at least, two main systems: the solar field and the power block. Regarding this last one, the particular thermodynamic cycle layout and the working fluid employed, have a decisive influence in the plant performance. In turn, this selection depends on the solar technology employed.

Can solar thermal power plants be integrated with conventional power plants?

Solar thermal power plants have enormous potential to be integrated with the existing conventional power plants. The integration of CSP systems with conventional power plants increases the efficiency, reduces the overall cost, and increases the dispatchability and reliability of the solar power generation system.

How can solar thermal components reduce the cost of electricity generation?

Advancements in the design of the solar thermal components improve the performance and consequently reduce the cost of electricity generation. This chapter discusses all the available CSP technologies and highlights the various design and operational parameters on which the overall efficiency of the solar power plants depends.

Can CR improve conversion efficiency of solar thermal power plants?

A typical Brayton cycle-based solar thermal power generation plant using CR is portrayed in Fig. 3.18. The optimization of the performance parameters in hybrid plants can lead to a better overall conversion efficiency of the plant. Schematic of a typical solar thermal power plant with CR

Are solar thermal power plants controllable?

Since power generation can be flexibly adapted to demand, solar thermal power plants are referred to as controllable power plants. Solar thermal power plants have an additional advantage. If there is little solar radiation for several days due to the weather, they can be operated in hybrid mode.

What is a solar thermal power plant?

Since steam turbines can only be operated economically above a certain minimum size, today's solar thermal power plants have rated outputs in the range of 50 to 200 megawatts. The main difference to a conventional steam power plant is the solar field, which supplies the heat for the steam generator.
