

## Solar thermal power generation project examples

Are solar thermal power plants the future of energy?

With approximately six gigawatts of installed capacity worldwide in 2020, solar thermal power plants are still at the beginning of their market introduction, comparable to photovol-taics 15 years ago or wind energy 25 years ago.

Can solar thermal power plants replace fossil fuel power plants?

Solar thermal power plants can replace fossil fuel power plants their role as base load and peak load generators. For direct, decentralised power supply to industrial areas, smaller CSP systems are economically interesting if the industrial customers buy not only electricity but also process heat. 4. Are solar thermal power plants competitive?

Why are solar thermal power plants important?

Since solar thermal power plants can feed their electricity into the power grid even after sunset, they are of particular value for an energy system based on renewable energy sources. Solar thermal power plants are of strategic importance in sunny countries to be able to phase out coal and gas power plants in the future.

Can solar thermal power plants be used in sunny countries?

In energy systems in sunny countries that rely on renewable energy sources, solar thermalinstead of fossil fuel power plants will be able to supply cost-effective base-load and peak-load electricity at low cost and stabilise the power grids.

Are solar thermal power plants controllable?

Since power generation can be flexibly adapted to demand, solar thermal power plants are referred to as controllable power plants. Solar thermal power plants have an additional advantage. If there is little solar radiation for several days due to the weather, they can be operated in hybrid mode.

What are the different types of concentrating solar thermal power systems?

There are three main types of concentrating solar thermal power systems: Linear concentrating systemscollect the sun's energy using long,rectangular,curved (U-shaped) mirrors. The mirrors focus sunlight onto receivers (tubes) that run the length of the mirrors. The concentrated sunlight heats a fluid flowing through the tubes.
