

Technical parameters of multifunctional energy storage system

Why is multi-energy storage important?

Multi-energy storage system employing different types of ESS helps to meet the complementary coordination between different types of energy storage, which is important in improving system flexibility, reliability and economy. Because of these advantages, the researches on hybrid energy storages of electricity and heat in RIES gradually rose.

What is a multi-energy storage optimal configuration model?

A multi-energy storage optimal configuration model considering PDN and DHN were established to optimize the installation position and capacity of EES and TES to minimize the comprehensive cost of RIES. Three methods were compared by computation efficiency and optimum results.

How a multi-energy storage system improves wind power consumption?

The configuration of multi-energy storage system improves the ability of wind power to be consumed. By storing excess power from wind turbine, the utilization rate of wind power can reach 91.3%. The stored power is released during the peak demand, which reduces the power purchase of the grid.

What is a two-stage optimization model of multi-energy storage configuration?

A two-stage optimization model of multi-energy storage configuration is developed. The sites and capacities of hybrid energy storages in power and thermal networks are optimized. Three methods to determine the installation locations are compared. The economics performances at different configuration strategies are compared.

What types of energy storage systems can ESETM evaluate?

ESETM currently contains five modules to evaluate different types of ESSs, including BESSs, pumped-storage hydropower, hydrogen energy storage (HES) systems, storage-enabled microgrids, and virtual batteries from building mass and thermostatically controlled loads. Distributed generators and PV are also available in some applications.

How to calculate storage material energy storage capacity?

The storage material energy storage capacity (ESC_{mat}) is calculated according to the type of TES technology:
i. ESC_{mat} for sensible = heat \times TES. . Eq. 4 cp_{mat}: Specific heat of the material [J \times kg⁻¹ \times K⁻¹]. M_{material}: mass of the storage material [kg]. ΔT_{sys} : Design temperature difference of the system [K].
