

How can rooftop solar photovoltaic (PV) arrays reduce building energy use?

Building rooftop solar photovoltaic (PV) arrays coupled with electrical storage are a demonstrated means for addressing building energy use since roof areas are often unobstructed to solar radiation and freely available for such utilization .,

Should PV systems be installed with electrical storage and insulating roofs?

Results show that installing PV systems with electrical storage and insulating roofs in the refurbishment scenario provides a cost-effective way to improve the thermal performance, while covering a large portion (55-80%) of annual energy and electrical needs.

Does a combined roof insulation refurbishment with PV affect health and safety?

Our recommendations for combined roof insulation refurbishment with added PV also has large potential impact on health and safety in existing apartment buildings during summer heat waves. Many flats in older apartment buildings with low levels of insulation in Europe lack cooling systems.

Can combining insulation with PV reduce energy use in residential buildings?

We found combining appropriate insulation with PV can provide a cost-effective option to reduce net primary energy use in residential buildings. Savings from insulation alone varied from 3% (apartment complex) to 17% (single-family).

Can a photovoltaic roof be integrated into a pitched roof?

The entire research was carried out as part of the Horizon 2020 HEART project. In more detail, the research analyzed the requirements of typical pitched tile roofs, which are currently the most common type in Europe, and developed a universal photovoltaic tile that can be easily and quickly integrated into such a type of roof.

How much energy is saved by insulating a multi-family roof?

Savings from insulation and PV from primary energy were 63.1% when combined with electrical storage. In relation to the impact of shading, cooling was reduced by 11.3% (Table 6, 827 kWh/year savings) in uninsulated multi-family roofs.
