

What is the growth rate of photovoltaics?

Between 1992 and 2023, the worldwide usage of photovoltaics (PV) increased exponentially. During this period, it evolved from a niche market of small-scale applications to a mainstream electricity source. From 2016-2022 it has seen an annual capacity and production growth rate of around 26% - doubling approximately every three years.

Which country produces the most electricity from solar photovoltaics?

Since the 1950s, when the first solar cells were commercially manufactured, there has been a succession of countries leading the world as the largest producer of electricity from solar photovoltaics. First it was the United States, then Japan, followed by Germany, and currently China.

Who is driving growth in the solar photovoltaic industry?

Various actors, from key businesses to state governments, are driving growth in an industry that shows no signs of slowing down. Find up-to-date statistics and facts on the solar photovoltaic industry in the United States.

What is the IEA photovoltaic power systems technology collaboration programme?

The IEA Photovoltaic Power Systems Technology Collaboration Programme, which advocates for solar PV energy as a cornerstone of the transition to sustainable energy systems. It conducts various collaborative projects relevant to solar PV technologies and systems to reduce costs, analyse barriers and raise awareness of PV electricity's potential.

Are solar PV supply chains cost-competitive?

Currently, the cost competitiveness of existing solar PV manufacturing is a key challenge to diversifying supply chains. China is the most cost-competitive location to manufacture all components of the solar PV supply chain. Costs in China are 10% lower than in India, 20% lower than in the United States, and 35% lower than in Europe.

Overview History of leading countries Solar PV nameplate capacity Current status History of market development See also External links The United States was the leader of installed photovoltaics for many years, and its total capacity was 77 megawatts in 1996, more than any other country in the world at the time. From the late 1990s, Japan was the world's leader of solar electricity production until 2005, when Germany took the lead and by 2016 had a capacity of over 40 gigawatts. In 2015, China surpassed Germany to become t...

Annual solar PV capacity additions need to more than quadruple to 630 gigawatts (GW) by 2030 to be on track with the IEA's Roadmap to Net Zero Emissions by 2050. Global production capacity for polysilicon, ingots, wafers, cells and ...
