

Water fire wind nuclear and solar power generation ratio

What percentage of electricity is generated by wind & solar?

Wind and solar accounted for 14% of U.S. electricity generation in 2022. In our February Short-Term Energy Outlook, we forecast that wind and solar will rise slightly, accounting for 16% of total generation in 2023 and 18% in 2024. Electricity generation from coal falls from 20% in 2022 and to 17% in both 2023 and 2024.

How much power is generated by renewables in 2023?

Power generation from renewables. Wind power generation dipped in 2023 from the huge record in 2022 to 425,235 gigawatt-hours, and its share of total power generated dipped to 10.0%. Wind-power generation by state: Hydropower dipped to 5.6% of total power generation.

How many types of energy sources are there?

The data presented here are collected from 37 countries across all continents for eight source groups, including three types of fossil sources (coal, gas, and oil), nuclear energy and four groups of renewable energy sources (solar energy, wind energy, hydro energy and other renewables including biomass, geothermal, etc.).

What is the breakdown of the energy mix by country?

These charts show the breakdown of the energy mix by country. First is the higher-level breakdown by fossil fuels, nuclear, and renewables. Then the specific breakdown by source, including coal, gas, oil, nuclear, hydro, solar, wind, and other renewables (which include bioenergy, wave, and tidal). This is given in terms of per capita consumption.

What percentage of electricity is generated by natural gas?

Natural gas accounted for 39% of electric power sector electricity generation last year, and we forecast its share to be similar in 2023 then fall to 37% in 2024. Electricity generation from renewable energy sources has been growing steadily in the United States over the past decade.

Will wind and solar generate more electricity in 2022?

It's this aspect of our STEO electricity generation forecast where most of the uncertainty lies. Wind and solar accounted for 14% of U.S. electricity generation in 2022. In our February Short-Term Energy Outlook, we forecast that wind and solar will rise slightly, accounting for 16% of total generation in 2023 and 18% in 2024.

As identified in the 2019 IEA report Nuclear Power in a Clean Energy System and confirmed in this report, life extension of existing nuclear power plants can be a highly cost effective investment opportunity for low-carbon generation. ...
