

What is a fish-light complementary photovoltaic panel

Do fishery complementary photovoltaic power plants affect meteorology and surface energy?

Therefore, solar power plants are rapidly developing in the renewable energy sector. However, many reports of solar power plants are on land, and extremely limited observational research has been conducted on the impacts of fishery complementary photovoltaic power plants (FPVs) on near-surface meteorology and surface energy.

Why is temperature difference important in fishery complementary PV power plant?

The difference in temperature in various water layers benefits the cultivation of different fish in the fishery complementary PV power plant. Fig. 6.

What is fish-light complementarity?

Fish-light complementarity is a fishery model in which photovoltaic panels are set up above aquaculture facilities to generate electricity and aquaculture activities are carried out in the waters below the photovoltaic panels. It has the characteristics of continuously producing clean energy on water and high-quality aquatic products underwater.

Where is China's largest fishery & photovoltaic power project located?

China has built its largest fishery and photovoltaic complementary power project in the city of Wenzhou in eastern Zhejiang Province. The Taihan project covers a surface area of approximately 4.7 square kilometers, with photovoltaic power generation on top and fish farming underneath.

What are the coordinates of the fishery complementary photovoltaic demonstration base?

The central coordinates of study area 32°17'55" N, 119°47'39" E, and the altitude is 2 m. The fishery complementary photovoltaic demonstration base is composed of four ponds of 5.7-8.9 acre. The FPV is located on the central pond with about the water depth from 2.5 m to 3 m.

What is fishery PV power (FPV)?

Nevertheless, the research sites are located on land, but land resources are scarce. The fishery PV power (FPV) plant is a new type of solar energy constructed on the water surface to avoid occupying land resources. Additionally, the efficiency of solar energy is greater than that of land because of the cooling effect of the lake.
