

What is the voltage of photovoltaic panels in substations

What is a solar substation?

The purpose of the substation is to collect all solar array power and feed into the grid after stepping up voltage to distribution level. This substation is based on an Arcadia design, modified for the project. Power flow is bottom to top, 34.5 kV bus to 115 kV bus. It will consist of the following major drawings (single-line drawings).

How does solar power flow through a substation?

Solar Plant Layout Power flow through the substation component begins at the collector arrangement, then flowing through 3 feeders the 34.5 kV bus, finally voltage is stepped up and sent to the 115 kV bus. Consult figure 4 for a simplified block. Detailed drawings are provided with the complementary documents outlined in the drawing list.

What are the components of a solar substation?

The substation contain all necessary components including transformers, protection relays, monitoring equipment, and capacitor bank. Due to increasing renewable energy standards set by RES, Black & Veatch is sponsoring a senior design project to design a 60 MW grid tied solar power plant with an attached 115kV/34.5 kV substation.

What is a PV panel?

Photovoltaic (PV) Panel PV panels or Photovoltaic panel is a most important component of a solar power plant. It is made up of small solar cells. This is a device that is used to convert solar photon energy into electrical energy. Generally, silicon is used as a semiconductor material in solar cells.

What are the different solar panel voltages?

These solar panel voltages include: Nominal Voltage. This is your typical voltage we put on solar panels; ranging from 12V, 20V, 24V, and 32V solar panels. Open Circuit Voltage (VOC). This is the maximum rated voltage under direct sunlight if the circuit is open (no current running through the wires).

How to calculate solar panel output voltage?

If you know the number of PV cells in a solar panel, you can, by using 0.58V per PV cell voltage, calculate the total solar panel output voltage for a 36-cell panel, for example. You only need to sum up all the voltages of the individual photovoltaic cells (since they are wired in series, instead of wires in parallel). Here is this calculation:

Each PV cell produces anywhere between 0.5V and 0.6V, according to Wikipedia; this is known as Open-Circuit Voltage or V_{OC} for short. To be more accurate, a typical open circuit voltage of a solar cell is 0.58 volts (at 77°F or 25°C). All the ...
