

# Why are photovoltaic panels made blue

Why are polycrystalline solar panels blue?

The blue color of a polycrystalline solar panel is a side-effect of both the way the silicon crystals reflect light, as well as from the anti-reflective coating that the panels are treated with. As was touched upon earlier, monocrystalline solar panels make use of one silicon crystal within each solar cell in the panel.

What is the difference between black and blue solar panels?

Differences in solar panels come from many sources, mainly the purity of the silicon used in the module. Most solar panels have a blue hue and are made with polycrystalline silicon, while the smaller percentage that appears black is made with monocrystalline silicon.

Why are blue solar panels better than monocrystalline solar panels?

The multiple crystals in the formation process create less silicon waste and require less energy than the monocrystalline process. It makes the blue-colored solar panels less expensive, but it also means blue panels are less efficient. Which Color is Better for My Home Solar Power System?

Why do solar panels look blue?

The color of the panel you see depends on how the manufacturer used silicon in the manufacturing process, and how that particular type of panel reacts to light. Some panels also appear blue because the manufacturer applied an anti-reflective coating to improve how well they absorb light and generate electricity.

Why do silicon panels look blue?

The silicon used is first melted and poured into a square shape. This creates the distinct blue color we see. These panels get their unique blue look because of how the silicon crystals are shaped. Those crystals are not perfectly lined up, so they sparkle in a way that looks blue.

What are the disadvantages of a polycrystalline solar panel?

One drawback of the polycrystalline solar panel, however, is that it is less efficient. This is a result of the solar cell being packed with numerous silicon crystals, which limits the space available for photons to travel through.

5 &#0183; Polycrystalline solar panels are one of the oldest types of solar panel in existence, with cells that are made by melting multiple silicon crystals and combining them in a square mould. These blue panels are less efficient, less ...
