

# Why do photovoltaic panels have color differences

What color is a solar panel?

The color of a solar panel depends on the type of silicon used during the manufacturing process. Black solar panels are more efficient because monocrystalline silicon captures sunlight more effectively than the polycrystalline variety.

What is the difference between black and blue solar panels?

Differences in solar panels come from many sources, mainly the purity of the silicon used in the module. Most solar panels have a blue hue and are made with polycrystalline silicon, while the smaller percentage that appears black is made with monocrystalline silicon.

Why are solar panels blue?

Solar panels are blue due to the type of silicon (polycrystalline) used for certain solar panels. The blue color is mainly due to an anti-reflective coating that helps improve the absorbing capacity and efficiency of the solar panels. Black solar panels (monocrystalline) are often more efficient as black surfaces more naturally absorb light.

Are color solar panels more expensive?

Color solar panels are more expensive since they are a bit of a luxury. If you want your solar panels in a color other than black or dark blue, you may expect to pay roughly \$14.00 extra per panel, although pricing might vary based on the size of the solar panel.

Do solar panels look different on a roof?

If the color of your solar panels is important, remember that monocrystalline and polycrystalline solar panels tend to appear differently on your roof. The typical mono solar panel will tend to have a darker black color, while the typical polycrystalline panel will typically come in a bluer color.

Why are blue solar panels better than monocrystalline solar panels?

The multiple crystals in the formation process create less silicon waste and require less energy than the monocrystalline process. It makes the blue-colored solar panels less expensive, but it also means blue panels are less efficient. Which Color is Better for My Home Solar Power System?
