

Wind and nuclear power generation failure

Could new nuclear power be a solution to Texas' energy crisis?

Without additional dispatchable power generation,traditionally from fossil fuels,Texas is vulnerable to power outages during peak demand periods if solar and wind power sources fall short. Thirty years after Texas' last nuclear plant opened,new nuclear generation could provide needed power without planet-warming greenhouse gas emissions.

Did wind turbines cause grid failure?

Data showed that failure to winterize power sources,principally natural gas infrastructure but also to a lesser extent wind turbines,had caused the grid failure,with a drop in power production from natural gas more than five times greater than that from wind turbines.

Are frozen wind turbines causing a boil-water advisory in Texas?

An unprecedented winter storm left 4 million people without power across the state,and put nearly half of all Texans under a boil-water advisory. Initial reports from the Electric Reliability Council of Texas (ERCOT),which manages the state's power grid,suggested frozen wind turbines were partially to blame.

Did wind turbines cause power outages?

Though frozen wind turbines were a contributing factor,wind shutdowns accounted for less than 13% of the outages,Dan Woodfin,senior director of system operations for ERCOT,told Bloomberg . Most of the power outages were due to losses in coal,natural gas and nuclear energy,according to ERCOT.

Did wind and solar get shut down in Texas?

This week,Texas Gov. Greg Abbott appeared on local TV in Dallas and blamed the state's power crisis on the devastating storm that disrupted power generation and froze natural gas pipelines. He didn't single out one power source to blame. Then he went on Fox News and gave a different story. "Wind and solar got shut down," he said.

Is wind power causing power outages?

Despite some speculation,it appears that a lot of the power generation that has gone offline has been primarily due to issues on the natural gas system\ . Dan Woodfin,a senior director at ERCOT,confirmed this during a Tuesday call with reporters.

OverviewCausesBackgroundImpactResponseAftermathSee alsoFurther readingThe winter storm caused a record low temperature at Dallas/Fort Worth International Airport of -2 °F (-19 °C) on February 16, the coldest in North Texas in 72 years. Most Texan homes, which infrequently see low temperatures, have poor insulation and are heated with inefficient electric resistance heaters, resulting in extremely high electricity demand. Power equi...
