

Wind power and photovoltaic power generation development and construction

What is the wind and PV power generation potential of China?

The wind and PV power generation potential of China is about 95.84 PWh, which is approximately 13 times the electricity demand of China in 2020. The rich areas of wind power generation are mainly distributed in the western, northern, and coastal provinces of China.

What are wind and solar photovoltaic (PV) power systems?

Wind and solar photovoltaic (PV) power form vital parts of the energy transition toward renewable energy systems. The rapid development of these two renewables represents an enormous infrastructure construction task including both power generation and its associated electrical grid systems, which will generate demand for metal resources.

What are the development modes for wind and PV power systems?

In terms of wind and PV power development modes: centralized and decentralized development, land and sea development, nearby and external development, multi-energy complementation, single and multi-scene development will be the direction of the future. Table 1. Relevant policies for integrated development in solar and wind energy systems in China.

How to promote a high-quality development of wind and solar power?

To comprehensively promote large-scale and high-quality development of wind and solar power, give priority to local and nearby development and utilization, speed up the construction of decentralized wind and distributed PV power in load centers and surrounding areas, and promote the application of low-wind wind power technologies.

How will solar PV & wind impact global electricity generation?

The share of solar PV and wind in global electricity generation is forecast to double to 25% in 2028 in our main case. This rapid expansion in the next five years will have implications for power systems worldwide.

What is the growth rate of wind and photovoltaic power in China?

During the 12th Five Year Plan for Economic and Social Development of the People's Republic of China (12th Five-Year Plan) period, the combined annual power generation of wind and photovoltaic (PV) power in China accounted for less than 4%, annual growth of about 0.6% (Fig. 1). Fig. 1.

In 2023, an estimated 96% of newly installed, utility-scale solar PV and onshore wind capacity had lower generation costs than new coal and natural gas plants. In addition, three-quarters of new wind and solar PV plants offered cheaper ...
